

Frogs (Rough Draft)

Frogs are amphibians. They spend most of there life in the water but sometimes they live on the land. They don't have tales. they are pretty small and have buldging eyes. Frogs have long back legs so they can jump. There are many kinds of frogs, but they all have the same basic body structure. The have large hind legs, short front legs, and a flat head and body with no neck.

The largest frog is from Africa. Its called a Goliath and its almost a foot long. The smallest frog is only $\frac{1}{2}$ inches long. Most frogs are green or brown, but some are Blue or other colors. They live almost every where accept where it is really cold like Antarctica. Most frogs live in Africa, true frogs live near the water. Lots of frogs live in the U.S. like leopard frogs and bullfrogs. Bullfrogs can grow up to 8 inches. There are also green frogs, pikerel frogs, and the wood frog.

Tree frogs live on all continents accept Antarctica. They are only about 2 inches and live in trees. Some other tree frogs are canyon tree frogs, pacific tree frogs, chorus frogs and cricket frogs. Cricket frogs live mostly on the ground. And there are leptodactylid frogs, narrowmouthed toads, spadefooted toads, and tailed frogs.

Frogs are good for humans in many ways. Like they eat bugs and they provide us with food. People all over the world eat frogs legs. I've never eatten a frog, but my Mom has and she said they taste like chicken. In school students study about frogs to learn about anatomy. Frogs are important, interesting, and fun to study.
